

## HYPERBOLIC FUNCTIONAL DIFFERENTIAL INCLUSIONS IN BANACH SPACES WITH NONLOCAL CONDITIONS

M. BENCHOHRA & S.K. NTOUYAS

**Abstract:** In this paper we investigate the existence of solutions to an hyperbolic functional differential inclusion in Banach spaces with nonlocal conditions. We shall rely on a fixed point theorem for condensing maps due to of Martelli.

**Keywords:** Nonlocal hyperbolic functional differential inclusion, convex valued multivalued map, existence, condensing map, fixed point.

### 1. Introduction

This paper is devoted to the study of the existence of solutions for the following hyperbolic functional differential inclusion (Darboux problem) with nonlocal conditions of the form:

$$\frac{\partial^2 u(x, y)}{\partial x \partial y} \in F(x, y, u(x, y)), \quad (x, y) \in J_a \times J_b = [0, a] \times [0, b] \quad (1.1)$$

$$u(x, y) + \sum_{i=1}^n f_i(x, y)u(x, b_i + y) = \phi(x, y), \quad (x, y) \in [-r_1, a] \times [-r_2, 0] \quad (1.2)$$

$$u(x, y) + \sum_{j=1}^m g_j(x, y)u(a_j + x, y) = \phi(x, y), \quad (x, y) \in [-r_1, 0] \times [-r_2, b] \quad (1.3)$$

where  $F : J_a \times J_b \times C([-r_1, 0] \times [-r_2, 0], E) \longrightarrow 2^E$  is a closed, bounded and convex valued multivalued map,  $\phi \in C([-r_1, a] \times [-r_2, b] \setminus (0, a] \times (0, b], E)$ ,  $f_i : [-r_1, a] \times [-r_2, 0] \rightarrow \mathbb{R}$ ,  $i = 1, \dots, n$ ,  $g_j : [-r_1, 0] \times [-r_2, b] \rightarrow \mathbb{R}$ ,  $j = 1, \dots, m$ ,  $a_j$ ,  $j = 1, \dots, m$ ,  $b_i$ ,  $i = 1, \dots, n$  are finite numbers such that  $0 < a_1 < a_2 < \dots < a_m \leq a$ ,  $0 < b_1 < b_2 < \dots < b_n \leq b$ ,  $a > 0$ ,  $b > 0$ ,  $r_1 > 0$ ,  $r_2 > 0$  and  $(E, |\cdot|)$  a separable Banach space.

For each  $u \in C[-r_1, a] \times [-r_2, b], E$  and each  $(x, y) \in J_a \times J_b$  the function  $u_{(x,y)} : [-r_1, 0] \times [-r_2, 0] \rightarrow E$  is defined by

$$u_{(x,y)}(s, t) = u(x + s, y + t), \quad \text{for each } (s, t) \in [-r_1, 0] \times [-r_2, 0].$$

In recent years several papers have been devoted to study the existence of solutions for partial differential and functional differential equations with nonlocal conditions. We refer for instance to the papers of Byszewski [5], [6], [7] and Człapiński [14]. The nonlocal conditions were introduced for the first time by Chabrowski [9] for studying linear parabolic problems. Conditions of this type can be applied in the theory of elasticity with better effect than the initial or Darboux conditions. By using the Kuratowski noncompactness measure Byszewski and Papageorgiou gave in [4] an existence result for solutions to nonlocal Darboux problem for an hyperbolic inclusion.

In this paper we shall give an existence result for the problem (1.1)-(1.3). The method we are going to use is to reduce the existence of solutions to problem (1.1)-(1.3) to the search for fixed points of a suitable multivalued map on the Banach space  $C([-r_1, a] \times [-r_2, b], E)$ . In order to prove the existence of fixed points, we shall rely on a fixed point theorem for condensing maps due to Martelli [25]. Our result, extends to the functional case the problem considered by Byszewski and Papageorgiou [4]. The case where  $f_i = 0, i = 1, 2, \dots, n, g_j = 0, j = 1, 2, \dots, m$  was studied recently by authors in [2]. This result is also a generalization of some results on initial and Darboux problems for hyperbolic differential and functional differential equations considered in the papers [3], [10], [11], [12], [13], [21], [22], [20], [15], [16], [18], [23], [26], [27].

## 2. Preliminaries

In this section, we introduce notations, definitions, and preliminary facts from multivalued analysis, which are used throughout this paper. In the sequel we will denote by  $C([-r_1, 0] \times [-r_2, 0], E)$  the Banach space of continuous functions from  $[-r_1, 0] \times [-r_2, 0]$  into  $E$  with the usual supremum norm  $\|\cdot\|$  and by  $C(J_a \times J_b, E)$  the Banach space of continuous functions from  $J_a \times J_b$  into  $E$  with the norm

$$\|z\|_\infty := \sup\{|z(x, y)| : (x, y) \in J_a \times J_b\}, \quad \text{for each } z \in C(J_a \times J_b, E).$$

A measurable function  $z : J_a \times J_b \rightarrow E$  is Bochner integrable if and only if  $|z|$  is Lebesgue integrable. (For properties of the Bochner integral see Yosida [28]).  $L^1(J_a \times J_b, E)$  denotes the Banach space of measurable functions  $z : J_a \times J_b \rightarrow E$  which are Bochner integrable.

Let  $(X, |\cdot|)$  be a Banach space. A multivalued map  $G : X \rightarrow 2^X$  is convex (closed) valued if  $G(x)$  is convex (closed) for all  $x \in X$ .  $G$  is bounded on bounded sets if  $G(B) = \cup_{x \in B} G(x)$  is bounded in  $X$  for any bounded set  $B$  of  $X$  (i.e.  $\sup_{x \in B} \{\sup\{|y| : y \in G(x)\}\} < \infty$ ).  $G$  is called upper semicontinuous (u.s.c.)

on  $X$  if for each  $x_* \in X$  the set  $G(x_*)$  is a nonempty, closed subset of  $X$ , and if for each open set  $B$  of  $X$  containing  $G(x_*)$ , there exists an open neighbourhood  $V$  of  $x_*$  such that  $G(V) \subseteq B$ .  $G$  is said to be completely continuous if  $G(B)$  is relatively compact for every bounded subset  $B \subseteq X$ . If the multivalued map  $G$  is completely continuous with nonempty compact values, then  $G$  is u.s.c. if and only if  $G$  has a closed graph (i.e.  $x_n \rightarrow x_*$ ,  $y_n \rightarrow y_*$ ,  $y_n \in G(x_n)$  imply  $y_* \in G(x_*)$ ).  $G$  has a fixed point if there is  $x \in X$  such that  $x \in G(x)$ .

In the following  $BCC(X)$  denotes the set of all nonempty bounded, closed and convex subsets of  $X$ .

A multivalued map  $G : J_a \times J_b \times C([-r_1, 0] \times [-r_2, 0], E) \rightarrow BCC(E)$  is said to be measurable if for each  $w \in E$  the function  $Y : J_a \times J_b \rightarrow \mathbb{R}$  defined by

$$Y(x, y) = d(w, G(x, y, u)) = \inf\{|w - v| : v \in G(x, y, u)\}$$

is measurable.

An upper semi-continuous map  $G : X \rightarrow 2^X$  is said to be condensing if for any subset  $B \subseteq X$  with  $\alpha(B) \neq 0$ , we have  $\alpha(G(B)) < \alpha(B)$ , where  $\alpha$  denotes the Kuratowski measure of noncompactness. For properties of the Kuratowski measure, we refer to Banaś and Goebel [1].

We remark that a completely continuous multivalued map is the easiest example of a condensing map. For more details on multivalued maps see the books of Deimling [17] and Hu and Papageorgiou [19].

**Definition 2.1.** A multivalued map  $J_a \times J_b \times C([-r_1, 0] \times [-r_2, 0], E) \rightarrow 2^E$  is said to be an  $L^1$ -Carathéodory if

- (i)  $(x, y) \mapsto F(x, y, u)$  is measurable for each  $u \in C([-r_1, 0] \times [-r_2, 0], E)$ ;
- (ii)  $u \mapsto F(x, y, u)$  is upper semicontinuous for almost all  $(x, y) \in J_a \times J_b$ ;
- (iii) For each  $k > 0$ , there exists  $h_k \in L^1(J_a \times J_b, \mathbb{R}_+)$  such that

$$\|F(x, y, u)\| = \sup\{|v| : v \in F(x, y, u)\} \leq h_k(t) \quad \text{for all } \|u\| \leq k$$

and for almost all  $(x, y) \in J_a \times J_b$ .

We will need the following hypotheses:

- (H1)  $F : J_a \times J_b \times C([-r_1, 0] \times [-r_2, 0], E) \rightarrow BCC(E)$  is an  $L^1$ -Carathéodory multivalued map and for each fixed  $u \in C([-r_1, a] \times [-r_2, b], E)$  the set

$$S_{F,u} = \left\{ v \in L^1(J_a \times J_b, E) : v(x, y) \in F(x, y, u_{(x,y)}) \text{ for a.e. } (x, y) \in J_a \times J_b \right\}$$

is nonempty.

- (H2) There exist functions  $p, q \in L^1(J_a \times J_b, \mathbb{R}^+)$  such that

$$\|F(x, y, u)\| := \sup\{|v| : v \in F(x, y, u)\} \leq p(x, y) + q(x, y)\|u_{(x,y)}\|$$

for almost all  $(x, y) \in J_a \times J_b$  and all  $u \in C([-r_1, a] \times [-r_2, b], E)$ .

(H3) there exist nonnegative constants  $M$  and  $N$  such that

$$|f_i(x, y)| \leq M \text{ for each } (x, y) \in [-r_1, a] \times [-r_2, 0], i = 1, \dots, n,$$

$$|g_j(x, y)| \leq N \text{ for each } (x, y) \in [-r_1, 0] \times [-r_2, b], j = 1, \dots, m,$$

and

$$nM + mN < 1.$$

(H4) For each bounded set  $B \subset C([-r_1, a] \times [-r_2, b], E)$  and for each  $(x, y) \in J_a \times J_b$  the set

$$\left\{ \phi(x, 0) + \phi(0, y) - \phi(0, 0) - \sum_{i=1}^n f_i(x, 0)u(x, b_i) - \sum_{j=1}^m g_j(0, y)u(a_j, y) + \int_0^x \int_0^y v(t, s) dt ds : v \in S_{F, B} \right\}$$

is relatively compact in  $E$ , where  $S_{F, B} = \cup\{S_{F, u} : u \in B\}$ .

**Remark 2.2.** (i) If  $\dim E < \infty$ , then for each  $u \in C(J_a \times J_b, E)$  the set  $S_{F, u}$  is nonempty (see Lasota and Opial [24]).

(ii) If  $\dim E = \infty$ , then  $S_{F, u}$  is nonempty if and only if the function  $Y : J_a \times J_b \rightarrow \mathbb{R}^+$  defined by

$$Y(x, y) := \inf\{|v| : v(x, y) \in F(x, y, u(x, y))\}$$

is measurable (see Hu and Papageorgiou [19]).

(iii) (H4) is satisfied if  $\dim E < \infty$  or if for each  $(x, y) \in J_a \times J_b$  the multivalued map  $F(x, y, \cdot)$  sends bounded sets of  $C([-r_1, 0] \times [-r_2, 0], E)$  into relatively compact sets.

**Definition 2.3.** By a solution of (1.1)-(1.3) we mean a function  $u(\cdot, \cdot) \in C([-r_1, a] \times [-r_2, b], E)$  such that, there exists  $v \in L^1(J_a \times J_b, E)$  for which we have

$$u(x, y) = \phi(x, 0) + \phi(0, y) - \phi(0, 0) - \sum_{i=1}^n f_i(x, 0)u(x, b_i) - \sum_{j=1}^m g_j(0, y)u(a_j, y) + \int_0^x \int_0^y v(t, s) dt ds, \quad (x, y) \in J_a \times J_b$$

and  $v(t, s) \in F(t, s, u(t, s))$  a.e. on  $J_a \times J_b$  and conditions (1.2) and (1.3) are satisfied.

Our considerations are based on the following lemmas.

**Lemma 2.4.** [24]. Let  $F$  be a multivalued map satisfying (H1) and let  $\Gamma$  be a linear continuous mapping from  $L^1(J_a \times J_b, E)$  to  $C(J_a \times J_b, E)$ , then the operator

$$\Gamma \circ S_F : C(J_a \times J_b, E) \longrightarrow CC(C(J_a \times J_b, E)), \quad u \longmapsto (\Gamma \circ S_F)(u) := \Gamma(S_{F,u})$$

is a closed graph operator in  $C(J_a \times J_b, E) \times C(J_a \times J_b, E)$ .

**Lemma 2.5.** [25]. Let  $X$  be a Banach space and  $N : X \longrightarrow BCC(X)$  be a condensing map. If the set

$$\Omega := \{u \in X : \lambda u \in N(u) \text{ for some } \lambda > 1\}$$

is bounded, then  $N$  has a fixed point.

### 3. Main result

Let  $D = [-r_1, a] \times [-r_2, b]$ ,  $\bar{D} = [-r_1, a] \times [-r_2, b] \setminus (0, a] \times (0, b]$ ,  $D_1 = [-r_1, a] \times [-r_2, 0]$ ,  $D_2 = [-r_1, 0] \times [-r_2, b]$ . Now, we are able to state and prove our main theorem.

**Theorem 3.1.** Assume that hypotheses (H1)-(H3) hold. Then the problem (1.1)–(1.3) has at least one solution on  $D$ .

**Proof.** Transform the problem (1.1)–(1.3) into a fixed point problem. Consider the multivalued map,  $N : C(D, E) \longrightarrow 2^{C(D, E)}$  defined by:

$$N(u) = \left\{ h \in C(D, E) : h(x, y) = \begin{cases} \phi(x, y) - \sum_{i=1}^n f_i(x, y)u(x, b_i + y), & (x, y) \in D_1 \\ \phi(x, y) - \sum_{j=1}^m g_j(x, y)u(x + a_j, y), & (x, y) \in D_2 \\ \phi(x, 0) + \phi(0, y) - \phi(0, 0) \\ - \sum_{i=1}^n f_i(x, 0)u(x, b_i) \\ - \sum_{j=1}^m g_j(0, y)u(a_j, y) \\ + \int_0^x \int_0^y v(t, s) dt ds, & (x, y) \in J_a \times J_b \end{cases} \right\}$$

where

$$v \in S_{F,u} = \left\{ v \in L^1(J_a \times J_b, E) : v(t, s) \in F(t, s, u(t, s)) \text{ for a.e. } (t, s) \in J_a \times J_b \right\}.$$

**Remark 3.2.** It is clear that the fixed points of  $N$  are solutions to (1.1)–(1.3).

We shall show that  $N$  satisfies the assumptions of Lemma 2.5. The proof will be given in several steps.

**Step 1.**  $N(u)$  is convex for each  $u \in C(J_a \times J_b, E)$ .

Indeed, if  $h_1, h_2$  belong to  $N(u)$ , then there exist  $v_1, v_2 \in S_{F,u}$  such that for each  $(x, y) \in J_a \times J_b$  we have

$$\begin{aligned} h_i(x, y) &= \phi(x, 0) + \phi(0, y) - \phi(0, 0) - \sum_{i=1}^n f_i(x, 0)u(x, b_i) \\ &\quad - \sum_{j=1}^m g_j(0, y)u(a_j, y) + \int_0^x \int_0^y v_i(t, s) dt ds, \quad i = 1, 2. \end{aligned}$$

Let  $0 \leq \alpha \leq 1$ . Then for each  $(x, y) \in J_a \times J_b$  we have

$$\begin{aligned} (\alpha h_1 + (1 - \alpha)h_2)(x, y) &= \phi(x, 0) + \phi(0, y) - \phi(0, 0) \\ &\quad - \sum_{i=1}^n f_i(x, 0)u(x, b_i) - \sum_{j=1}^m g_j(0, y)u(a_j, y) \\ &\quad + \int_0^x \int_0^y [\alpha v_1(t, s) + (1 - \alpha)v_2(t, s)] ds. \end{aligned}$$

Since  $S_{F,u}$  is convex (because  $F$  has convex values) then

$$\alpha h_1 + (1 - \alpha)h_2 \in N(u).$$

**Step 2.**  $N$  is bounded on bounded sets of  $C(J_a \times J_b, E)$ .

Indeed, it is enough to show that there exists a positive constant  $c$  such that for each  $h \in N(u)$ ,  $u \in B_r = \{u \in C(J_a \times J_b, E) : \|u\|_\infty \leq r\}$  one has  $\|h\|_\infty \leq c$ .

If  $h \in N(u)$ , then there exists  $v \in S_{F,u}$  such that for each  $(x, y) \in J_a \times J_b$  we have

$$\begin{aligned} h(x, y) &= \phi(x, 0) + \phi(0, y) - \phi(0, 0) - \sum_{i=1}^n f_i(x, 0)u(x, b_i) \\ &\quad - \sum_{j=1}^m g_j(0, y)u(a_j, y) + \int_0^x \int_0^y v(t, s) dt ds. \end{aligned}$$

By (H1) we have for each  $(x, y) \in J_a \times J_b$  that

$$\begin{aligned} |h(x, y)| &\leq |\phi(x, 0)| + |\phi(0, y)| + |\phi(0, 0)| \\ &\quad + \sum_{i=1}^n |f_i(x, 0)||u(x, b_i)| + \sum_{j=1}^m |g_j(0, y)||u(a_j, y)| + \int_0^x \int_0^y |v(t, s)| dt ds \\ &\leq |\phi(x, 0)| + |\phi(0, y)| + |\phi(0, 0)| + nrM + mrN + \int_0^x \int_0^y h_r(t, s) dt ds. \end{aligned}$$

Then

$$\|h\|_\infty \leq 3\|\phi\|_\infty + nrM + mrN + \int_0^a \int_0^b h_r(t, s) dt ds = c.$$

**Step 3.**  $N$  sends bounded sets of  $C(J_a \times J_b, E)$  into equicontinuous sets.

Let  $(x_1, y_1), (x_2, y_2) \in J_a \times J_b$ ,  $x_1 < x_2$ ,  $y_1 < y_2$  and  $B_r$  be a bounded set of  $C(J_a \times J_b, E)$ . For each  $u \in B_r$  and  $h \in N(u)$ , there exists  $v \in S_{F,u}$  such that

$$\begin{aligned} h(x, y) &= \phi(x, 0) + \phi(0, y) - \phi(0, 0) - \sum_{i=1}^n f_i(x, 0)u(x, b_i) \\ &\quad - \sum_{j=1}^m g_j(0, y)u(a_j, y) + \int_0^x \int_0^y v(t, s) dt ds. \end{aligned}$$

Thus we obtain

$$\begin{aligned} |h(x_2, y_2) - h(x_1, y_1)| &\leq |\phi(x_2, 0) - \phi(x_1, 0)| + |\phi(0, y_2) - \phi(0, y_1)| \\ &\quad + \sum_{i=1}^n |f_i(x_1, 0)u(x_1, b_i) - f_i(x_2, 0)u(x_2, b_i)| \\ &\quad + \sum_{j=1}^m |g_j(0, y_1)u(a_j, y_1) - g_j(0, y_2)u(a_j, y_2)| \\ &\quad + \int_{x_1}^{x_2} \int_{y_1}^{y_2} |v(t, s)| dt ds \\ &\leq |\phi(x_2, 0) - \phi(x_1, 0)| + |\phi(0, y_2) - \phi(0, y_1)| \\ &\quad + \sum_{i=1}^n |f_i(x_1, 0) - f_i(x_2, 0)||u(x_1, b_i)| \\ &\quad + |f_i(x_2, 0)||u(x_1, b_i) - u(x_2, b_i)| \\ &\quad + \sum_{j=1}^m |g_j(0, y_1) - g_j(0, y_2)||u(a_j, y_1)| \\ &\quad + |g_j(0, y_2)||u(a_j, y_1) - u(a_j, y_2)| \\ &\quad + \int_{x_1}^{x_2} \int_{y_1}^{y_2} h_r(t, s) dt ds. \end{aligned}$$

As  $(x_2, y_2) \rightarrow (x_1, y_1)$  the right-hand side of the above inequality tends to zero.

As a consequence of Step 2, Step 3 and (H4) together with the Arzela-Ascoli theorem we can conclude that  $N$  is completely continuous and therefore a condensing multivalued map.

**Step 4.**  $N$  has a closed graph.

Let  $u_n \rightarrow u_*$ ,  $h_n \in N(u_n)$ , and  $h_n \rightarrow h_*$ . We shall prove that  $h_* \in N(u_*)$ .

$h_n \in N(u_n)$  means that there exists  $v_n \in S_{F, u_n}$  such that

$$\begin{aligned} h_n(x, y) &= \phi(x, 0) + \phi(0, y) - \phi(0, 0) - \sum_{i=1}^n f_i(x, 0)u_n(x, b_i) \\ &\quad - \sum_{j=1}^m g_j(0, y)u_n(a_j, y) + \int_0^x \int_0^y v_n(t, s) dt ds. \end{aligned}$$

We must prove that there exists  $g_* \in S_{F, u_*}$  such that

$$\begin{aligned} h_*(x, y) &= \phi(x, 0) + \phi(0, y) - \phi(0, 0) - \sum_{i=1}^n f_i(x, 0)u_*(x, b_i) \\ &\quad - \sum_{j=1}^m g_j(0, y)u_*(a_j, y) + \int_0^x \int_0^y v_*(t, s) dt ds. \end{aligned}$$

Now, we consider the linear continuous operator

$$\Gamma : L^1(J_a \times J_b, E) \longrightarrow C(J_a \times J_b, E)$$

$$v \longmapsto \Gamma(v)(x, y) = \int_0^x \int_0^y v(t, s) dt ds, \quad (x, y) \in J_a \times J_b.$$

From Lemma 2.4. it follows that  $\Gamma \circ S_F$  is a closed graph operator. Clearly we have

$$\begin{aligned} &\| (h_n(x, y) - \phi(x, 0) - \phi(0, y) + \phi(0, 0) \\ &\quad + \sum_{i=1}^n f_i(x, 0)u_n(x, b_i) + \sum_{j=1}^m g_j(0, y)u_n(a_j, y)) \\ &\quad - (h_*(x, y) - \phi(x, 0) - \phi(0, y) + \phi(0, 0) \\ &\quad + \sum_{i=1}^n f_i(x, 0)u_*(x, b_i) + \sum_{j=1}^m g_j(0, y)u_*(a_j, y)) \|_\infty \rightarrow 0 \end{aligned}$$

as  $n \rightarrow \infty$ . Moreover from the definition of  $\Gamma$  we have

$$\begin{aligned} &(h_n(x, y) - \phi(x, 0) - \phi(0, y) + \phi(0, 0) + \sum_{i=1}^n f_i(x, 0)u_n(x, b_i) \\ &\quad + \sum_{j=1}^m g_j(0, y)u_n(a_j, y)) \in \Gamma(S_{F, u_n}). \end{aligned}$$

Since  $u_n \rightarrow u_*$ , it follows from Lemma 2.4. that

$$\begin{aligned} h_*(x, y) - \phi(x, 0) - \phi(0, y) + \phi(0, 0) + \sum_{i=1}^n f_i(x, 0)u_*(x, b_i) + \sum_{j=1}^m g_j(0, y)u_*(a_j, y) \\ = \int_0^x \int_0^y v_*(t, s) dt ds, \quad (x, y) \in J_a \times J_b \end{aligned}$$

for some  $v_* \in S_{F, u_*}$ .

**Step 5.** *The set*

$$\Omega := \{u \in C(J_a \times J_b, E) : \lambda u \in N(u) \text{ for some } \lambda > 1\}$$

is bounded.

Let  $u \in \Omega$ . Then  $\lambda u \in N(u)$  for some  $\lambda > 1$ . Thus there exists  $v \in S_{F, u}$  such that

$$\begin{aligned} u(x, y) = \lambda^{-1} \phi(x, 0) + \lambda^{-1} \phi(0, y) - \lambda^{-1} \phi(0, 0) - \lambda^{-1} \sum_{i=1}^n f_i(x, 0)u(x, b_i) \\ - \lambda^{-1} \sum_{j=1}^m g_j(0, y)u(a_j, y) + \lambda^{-1} \int_0^x \int_0^y v(t, s) dt ds. \end{aligned}$$

This implies by (H2) and (H3) that for each  $(x, y) \in J_a \times J_b$  we have

$$\begin{aligned} |u(x, y)| \leq |\phi(x, 0)| + |\phi(0, y)| + |\phi(0, 0)| + (nM + mN)\|u\| \\ + \int_0^x \int_0^y (p(t, s) + q(t, s)\|u_{(t, s)}\|) dt ds. \end{aligned}$$

We consider the function  $\mu$  defined by

$$\mu(x, y) = \sup\{|y(t, s)| : (t, s) \in [-r_1, x] \times [-r_2, y]\}, \quad (x, y) \in J_a \times J_b.$$

Let  $(x^*, y^*) \in [-r_1, x] \times [-r_2, y]$  be such that  $\mu(x, y) = |y(x^*, y^*)|$ . If  $(x^*, y^*) \in J_a \times J_b$ , by the previous inequality we have for  $(x, y) \in J_a \times J_b$

$$\begin{aligned} \mu(x, y) \leq |\phi(x, 0)| + |\phi(0, y)| + |\phi(0, 0)| + (nM + mN)\mu(x, y) + \|p\|_{L^1(J_a \times J_b)} \\ + \int_0^x \int_0^y q(t, s)\|u_{(t, s)}\| dt ds \\ \leq 3\|\phi\| + (nM + mN)\mu(x, y) + \|p\|_{L^1(J_a \times J_b)} + \int_0^x \int_0^y q(t, s)\mu(t, s) dt ds. \end{aligned}$$

Thus

$$\mu(x, y) \leq \frac{1}{1 - nM - mN} \left[ 3\|\phi\| + \|p\|_{L^1(J_a \times J_b)} + \int_0^x \int_0^y q(t, s)\mu(t, s) dt ds \right].$$

Invoking Gronwall's inequality we get that

$$\mu(x, y) \leq \frac{1}{1 - nM - mN} \left[ 3\|\phi\| + \|p\|_{L^1(J_a \times J_b)} \exp\|q\|_{L^1(J_a \times J_b)} \right] = \mathcal{M}.$$

Since for every  $(x, y) \in J_a \times J_b$ ,  $\|u_{(x,y)}\| \leq \mu(x, y)$ , we have

$$\|u\|_\infty := \sup\{|u(x, y)| : (x, y) \in D\} \leq \mathcal{M}.$$

This shows that  $\Omega$  is bounded.

Set  $X := C(D, E)$ . As a consequence of Lemma 2.5. we deduce that  $N$  has a fixed point which is a solution of (1.1)-(1.3) on  $D$ .
